The novel bacterium is useful for producing L-amino acid e.g. L-Thr, L-Val, L-Pro, L-Leu, L-Met and L-Arg, by cultivating the bacterium in a culture medium and collecting L-amino acid to be produced and accumulated from the culture medium. The present sequence represents a protein of the invention which causes increased L-amino acid production in E. coli
                                                                                                                                                                                                                                                                                  Tumor-ass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel L-amino acid producing Escherichia bacterium, is modified to enhance L-amino acid production by enhancing the activities of protein capable of making bacterium to have enhanced resistance to L-amino acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an L-amino acid producing bacterium belonging to the genus Escherichia, where the bacterium has been modified so that the L-amino acid production by the bacterium is enhanced by enhancing activities of proteins by transformation of the bacterium with DNA coding for protein or by alteration of an expression regulation sequence of the DNA on the chromosome of the bacterium. The L-amino acid producing bacterium is useful for producing L-amino acid by fermentation, including L-threonine, L-valine, L-proline, L-methionine, or L-arginine. The genes are useful for improving L-amino acid productivity. This sequence corresponds to the D2683 protein, one of the L-amino acid biosynthesis pathway proteins. The protein is a putative transport this protein increases production on L-threonine, L-valine, L-leucine, L-proline and L-methionine.

Also described is a method for producing (A) comprising cultivating the bacterium in a culture medium and collecting the produced and accumulated Leamino acid. The modified bacterium has the ability to grow on a minimal medium containing L-amino acid or its analog in a minimal concentration and ability to grow faster on a medium containing L-amino acid or its analog than the unmodified strain or the wild type strain, or the parental strain of the bacterium. The present sequence represents the E. coli b2683 protein which has L-amino acid excretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MSYEVILLGILVGVANYCFRYLPIRLRVGNARPTKRGAVGILLDTIGIASICALLVVSTA 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element, and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding a Klebsiella pneumoniae polypeptide, useful for preparing a vaccine composition against Klebsiella pneumoniae.

ANK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54912 to AAK54950 and AAM82169
represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                     Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Acinetobacter baumannii; bacterial disease; antibacterial; vaccine; plant biocontrol agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          63
                                                                                                                                                                                                                                                        The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense; prokaryotic essential gene; cell proliferation; drug design.

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
comprising a promoter operably linked to the nucleic acid
polypeptide or its fragment whose expression is inhibited by the antisense
completed acid; (4) an antibody capable of specifically binding
completed or its fragment whose expression is inhibited by the
completed or or the activity of a gene in an operon required for
proliferation or the activity of a gene in an operon required for
complete product or that has an activity against a biological pathway
compound a gene required for cellular proliferation or the biological
pathway in which a proliferation-required gene or its gene product lies
compound a activity, (11) a culture comprising strains in which the gene
compound activity, (11) a culture comprising strains in which the gene
compound activity, (11) a culture comprising strains in which the gene
compound sactivity, (11) a culture comprising strains in which the gene
compound sactivity, (11) a culture comprising strains in which the gene
compound sactivity, (11) a culture comprising strains in which the gene
compound sactivity, (11) a culture comprising strains in compound that inhibits the
compound sactivity, (12) a compound that inhibits the
compound sactivity, (13) identifying the target of a compound that inhibits the
compound sacraning for homologous nucleic acids are useful for
continuation of an organism. The antisense nucleic acids are useful for
continuation of an organism to isolate continuation of an organism to isolate continuation of an organism. The antisense nucleic acids are useful for
continuation of an organism to isolate continuation of an organism to isolate continuation of an organism to isolate continuation of an organism ancie
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense; prokaryotic essential gene; cell proliferation; drug design.

                                                                                                                                                                                                                                                                                                                                                                                                                                            (SLAT/
 the invention fraintee to an interact and compilating any one to the fall antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a prooliferation of a cell. Also included are:

(2) a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated purpleptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits proliferation or the biological pathway required for cellular proliferation of an identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene or which he test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the confidentifying proteins or screening for homologous nucleic acids are useful for dentifying the cramping or conjugate models activity of a correction of an organism. The antisense nucleic acids are useful for for cellular proliferation to solate candidate molecules for rational
                                                                                                                                                                                 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant comprising the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plant properties. Increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan in the production or improved galactomannan is the production or improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan is the production or improved galactomannance in the production or improved plant growth and evelopment under at least one stress condition, improved lignin production or improved galactomannance in the production or improved plant growth and evelopment under at least one stress condition, improved lignin production or improved galactomannance in the production or improved galactomannance in the production or improved plants growth and evel method to the production or improved galactomannance in the production or improved galactomannance in the production or improved galactomance in the production or improved galactom production 
New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     90 LVSGSLAGVTSVPFTY-PLELIRVRLAFPTKREGRSSLRSIIRQIYSENALTVPKNAPAS 148

 The invention relates to a human glucose transporter (GLUTX) protein. The protein can be expressed by standard recombinant methodology GLUTX nucleic acids are useful as hybridization probes for detecting the presence of GLUTX DNA in a sample, useful for diagnosing conditions associated with aberrant expression levels of GLUTX. The GLUTX gene is also useful as a therapeutic agent for regulating translations of GLUTX mRNA, and for treatment of disorders associated with aberrant expression of GLUTX and aberrant hexose transport. It is useful for generating GLUTX genetific antibodies, identifying agonists and antagonists of GLUTX, and identifying nucleic acids in other species encoding nucleic acids homologous to GLUTX. GLUTX nucleic acids are also useful for identifying the chromosomal location of GLUTX, and as tissue specific markers.

Sequences AAY27287-291 represent GLUTX.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A novel mammalian transporter protein and the gene encoding it, are useful in the diagnosis and treatment of disorders associated with

The invention relates to a recombinant DNA construct comprising a provided for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant cuch as maize or soybean. The method of producing a transformed plant with the eventual and improved property. The plant is a crop plant cuch as maize or soybean. The method of producing a plant with the tereombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plants with construct is useful for improved plant properties, e.g. improved cold, heat or a drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or persact increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified sease, better growth rate by modification of carbohydrate, introgen or phosphorus use and/or uptake, by modification of farbohydrate, introgen or providing improved plant growth and development under at least one stress condition, improved light production or improved galactonannan condition, improved light production or improved galactonannan condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence detail for this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           13.9%; Score 76.5; DB 8; Length 500; 25.2%; Pred. ```
This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity egg. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABU65041-ABU65218 represent the NOVX polypeptides encoded by
 SVEMLILGRICHINGLECGLCTGFVP--MYIGEISPTALRGAFG-TLNQLGIVIGILVAQVI 175
 NOVX polypeptides and polynucleotides, useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g., cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial

The invention relates to an isolated polypeptide (designated NOVX, or NOVI-NOVI27) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fargments). Also included are an isolated nucleic acid molecule encoding NOVX, a vector comprising the presence or amount of the polypeptide or the nucleic acid determining the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject, a method for identifying an agent that binds to the above polypeptide or nucleic acid molecule in a first mammalian subject, a method for identifying a potential therapeutic agent for subject, a method for identifying a potential therapeutic agent for use in the treatment of a pathology that is related to aberrant expression or physiological interactions of the polypeptide, a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating the activity of the polypeptide cited above. The composition and methods are useful for diagnosing, preventing or treating diseases such as diabetes, observing to a method diseases, anorexia, cancer-associated cachexia, cancer, neurodegenerative disearces like Alzheimer's disease or barkinson's disease, immune disorders, haematopoletic disorders, dysease or dyslipidaemias, and other chronic diseases. These may also be used in
 New NOVX polypeptides and nucleic acid molecules useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 The invention relates to a novel L-amino acid producing bacterium of genus Escherichia, modified to enhance L-amino acid production by enhancing the activities of a protein. The novel bacterium is useful for producing L-amino acid e.g. L-Thr, L-Val, L-Pro, L-Leu, L-Met and L-Arg, by cultivating the bacterium in a culture medium and collecting L-amino acid to be produced and accumulated from the culture medium. The present sequence represents a gene of the invention which causes increased L-amino acid production in E. coli
 Novel L-amino acid producing Escherichia bacterium, is modified to enhance L-amino acid production by enhancing the activities of protein capable of making bacterium to have enhanced resistance to L-amino acids.

The invention relates to an L-amino acid producing bacterium belonging to the genus Escherichia, where the bacterium has been modified so that the L-amino acid production by the bacterium is enhanced by enhancing activities of proteins by transformation of the bacterium with DNA coding for protein or by alteration of an expression regulation sequence of the DNA on the chromosome of the bacterium. The L-amino acid producing bacterium is useful for producing L-amino acids by fermentation, including L-threonine, L-valine, L-proline, L-methionine, or L-arginine. The genes are useful for improving L-amino acid productivity. This sequence corresponds to the ygal gene encoding protein bis so of the L-amino acid biosynthesis pathway proteins. The protein is a putative transport protein within the biosynthesis pathway. Enhancement of the expression of this gene increases production on L-threonine, L-valine, L-leucine, L-proline and L-methionine.

 Š
 (belonging to the genus Bacherichia), which is modified to enhance the production of (A) by enhancing the activities of proteins (G) or (H) in a cell of (I). Also described is a method for producing (A) comprising cultivating the bacterium in a culture medium and collecting the produced and accumulated L-amino acid. The modified bacterium has the ability to grow on a minimal medium containing L-amino acid or its analog in a minimal concentration and ability to grow faster on a medium containing L-amino acid or its analog than the unmodified strain or the wild type strain, or the parental strain of the bacterium. The present sequence encodes the E. coli b2683 protein which has L-amino acid excretion

(HUMA-) HUMAN GENOME SCI INC.

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Disclosure; SEQ ID NO 25440; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cactivity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased cypression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cyplynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, cancers and cancer metastases of haematopoietic-derived cells. AAK64703 cancers and cancer metastases of haematopoietic-derived cells. AAK64703 sequences from the present invention. AAK54942 to AAK84950 and AAM82169

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM; Rosen CA, Barash SC,

WPI; 2001-483426/52. P-PSDB; AAM84790.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

Claim 1; SEQ ID NO 2631; 3071pp + Sequence Listing; English.

and AMK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis an treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I)

```
polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 sequences from the present invention. AAK54942 to AAK874950 and AAM82169 represent sequences used in the exemplification of the present invention

from base 2000001 (Photorhabdus luminescens nucleot LOCUS ACF67367 Accession Acf67367
 The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens, e.g. in foods. The genes, proteins Ab and cells that carry a gene-containing vector are used to select compounds that animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. Combinant production of the proteins, particularly toxins and antibocrerials useful as insecticides, bactericides and fungicides. The genes, proteins useful as insecticides, bactericides and fungicides. The carry sectors containing the genes and Ab are also useful to the appentically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens end to raibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. Luminescens is a model (particularly plague and whooping cough). This

containing many identical probes. The probes are nucleotide sequences of 10-80 bases, are prepared ex situ from synthetic oligonucleotides and at least one includes a segment of at least 20 bases identical with, or complementary to, a segment of an open reading frame (orf) of Escherichia complementary to, a segment of an open reading frame (orf) of Escherichia (orli K12. The biochip is used for specific detection of gene expression in K12 and for determining the gene expression pattern, e.g. for diagnostic determining the gene expression pattern, e.g. for and to determine the effects of e.g. growth media on gene expression. The biochip provides as comprehensive as possible detection of the K12 genome, with simultaneous analysis of many different genes with a single device, and comparison of gene expression between K12 and its mutants or other E. coli strains in a single experiment. Apart from qualitative and comparison of gene expression, it also allows measurements of population densities for the various strains. The use of synthetic oligonucleotides for preparation of probes allows free variation in probe length and ensures high purity (and thus selectivity, reactivity and reproducibility); also synthetic probes are generally shorter than probe spreaded by polymerase chain reaction. Accessibed

```
The present sequence is the promoter of the Escherichia coli multidrug transporter protein gene emrR. The promoter can be used in the method of the invention for identifying a DNA molecule that encodes a natural product having bloactivity, or a protein involved in the production of the natural product. The method involves: (a) providing a transformed a bacterial cell comprising (i) a gene fusion encoding a reporter protein product, and (ii) an exogenous DNA that encodes the natural product or the protein involved in production of the natural product or the transformed bacterial cell under conditions that permit product or the natural product; and (c) detecting the presence of the reporter protein within the transformed bacterial cell
 Identifying a DNA molecule that encodes, or a protein involved in the production of, a natural product having bioactivity by incubating the transformed bacterial cell under conditions that permit the production of

screening New antisense nucleic acids, useful for identifying proteins or screfor homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 27599; 1766pp; English

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an bost cell containing the vector; (3) an isolated polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the est compound that inhibits proliferation of the strains is present in a culture or collection of corganism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense mucleic acids required for cillular proliferation in calls other than S. aureus, S. typhimurium, CC formy discovery programs, or for screening homologous nucleic acids required for proliferation in calls other than S. aureus, S. typhimurium, CC prokaryotic essential genes. The present sequence is one of the target prover programs, or the sequence data for this patent did cont the princed specification, but was obtained in cell or electronic formated and present in the present of the princed or contractors. ftp.wipo.int/pub/published\_pct\_sequences

XhoI; The cDNA library was constructed from mRNA isolated germinating shoots of the cultivar Williams. The seeds were allowed to germinate for 24 hours prior to being cold stressed for 2 days at 4C. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction Site. ECORI adapters were ligated to the blunt-ended cDNA fragments directionally cloned into the ECORI-XhoI restriction site of the pBluescript vector: The ligated cDNA fragments were transformed into DNA fragments were transformed into the laboratory of Dr. Randy
was constructed in the laboratory of Dr. Randy
 Figure 1. Standard Month Ledu When it has been determined, an EST from the other end of this clone is alieted in the 'Other STFs on clone' field. This clone is available through: Biogenetic Services, 801 32nd Ave. Brookings, SD 57006 USA (phone: 800 423 4163; email: info@biogeneticservices.com) Insert Length: 1836 Std Error: 0.00 High quality sequence stop: 421.

/note="Vector: pallescript II SK+; Site 1: BCORI; Site 2: XhoI; The CDNA library was constructed from mRNA isolated germinating shoots of the cultivar Williams. The seeds were allowed to germinate for 24 hours prior to being cold stressed for 2 days at 4C. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This library was constructed in the laboratory of Dr. Randy
 BB844978 RIKEN full-length enriched, adult male kidney Mus musculus CDNA clone F520002L02 5', mRNA sequence.
